Co$_3$O$_4$@SiO$_2$ MNPs = Cobalt (II,III) oxide/porous-silicananocomposites.

EXPERIMENTAL PROCEDURE:

The Co$_3$O$_4$@SiO$_2$ MNPs were prepared according to the experimental procedure. All compounds afforded spectral data. The Co$_3$O$_4$@SiO$_2$ nanocomposites were prepared in two steps according to the procedure described by Ghasemzadeh et al. with some modifications [25].

First step, formation of cobalt (II,III) oxide (Co$_3$O$_4$) NPs: A warm (50 °C) solution including cobalt (II) nitrate hexa-hydrate (8.60 g) in ethanol (100 mL) was prepared with vigorous stirring and kept for 30 minutes. Then, oxalic acid (2.14 g) was quickly added to the solution and stirred at 50 °C for 2 hours. The formed precipitates of cobalt (II) oxalate were collected by centrifuge, washed with ethanol, dried at room temperature and finally calcined for 2 hours at 400 °C to produce the dark cobalt(II,III) oxide nanoparticles.

Second step, formation of Co$_3$O$_4$@SiO$_2$ core-shell nanocomposites: To a mixture containing Co$_3$O$_4$ nanoparticles (0.5 g), ethanol (350 mL) and cetyltrimethylammonium bromide (2.2 g) were added dropwise to a concentrated ammonia aqueous solution (40 mL, 28 wt%) under sonication for 20 minutes. Then, tetraethylorthosilicate (0.4 mL) in ethanol (10 mL) was added to the above mixture under ultrasound irradiation and stirred at room temperature for 20 hours. The Co$_3$O$_4$/porous-silica core-shell nanocomposites were collected by centrifugation and washed three times with deionized water, and finally calcined at 600 °C for 6 hours.

SPECTROSCOPIC DATA:

The structure and magnetic characterization of Co$_3$O$_4$@SiO$_2$ were done by using various spectroscopic analyses including FT-IR, X-ray powder diffraction, scanning electron microscopy, energy dispersive X-ray spectroscopy, and vibrating sample magnetometer.
